

Consent and Release Agreement

This form is designed to give you the information needed to make an informed decision as to whether or not to undergo a 3D eyebrow microblading or permanent makeup application. If you have any questions, please don't hesitate to ask.

Although 3D eyebrow microblading is effective in most cases, no guarantee can be made that a specific client will benefit from the procedure. This is the process of inserting pigment into the basal layer of the epidermis. It is a form of tattooing, though semi-permanent. Generally, the results are excellent. However, a perfect result is not a realistic expectation. It is usual and advised to expect a touchup session after healing is completed.

Initially, the color will appear more vibrant or darker compared to the end result. Usually within 5-7 days, the color will fade 40-50%, soften and look more natural. The pigment is semi-permanent and will fade over time. Additional touchups are likely needed within 6 months to 2 years.

All instruments that enter the skin or come in contact with body fluids are disposable and disposed of after use. Cross contamination guidelines are strictly adhered to.

Possible Risks, Hazards or Complications

Pain: There can be pain even after the topical anesthetic has been used. Anesthetics work better on some people than on others.

Infection: Infection is very unusual. The areas treated must be kept clean, and only freshly cleaned hands should touch the areas. See "After Care" sheet for instruction on care.

Uneven Pigmentation: This can result from poor healing, infection, bleeding, or many other causes. Your follow-up appointment will likely correct any uneven appearance.

Asymmetry: Every effort will be made to avoid asymmetry, but our faces are not symmetrical so adjustments may be needed during the follow-up session to correct any unevenness.

Excessive Swelling or Bruising: Some people bruise or swell more than others. Ice packs may help reduce the swelling. The swelling or bruising typically disappears in 1-5 days. Some people don't bruise or swell at all.

Anesthetics: Topical anesthetics are used to numb the area to be tattooed. Lidocaine, Prilocaine, Benzocaine, Tetracaine, and/or Epinephrine cream and/or liquid are used. If you are allergic to any of these, please inform me now.

MRI: Because pigments used in permanent/semi-permanent cosmetic procedures contain inert oxides, a low level magnet may be required if you need to be scanned by an MRI machine. You must inform your MRI Technician of any tattoos.

The alternative to the risks listed here is to use traditional cosmetics and NOT undergo the semi-permanent eyebrow microblading procedure.
